**A. Personal Statement**

My research focuses on understanding the population dynamics of pathogens within and among wildlife populations, livestock, and humans. I have conducted fieldwork in Asia for the past 10 years, focused on the evolution, dynamics and co-evolution of host-pathogen (rodent-virus, bat-virus) interactions using phylogenetic and phylogeographic tools. My main interest is to analyze the risk of zoonotic pathogen transmission at human-wildlife interfaces. My published work analyzes patterns and incidence of pathogen sharing among species, and to determine how the host phylogenetic and phylogeographic structure affects pathogen distribution and cross-species transmission. Prior to my current position at EcoHealth Alliance, I was a Marie Curie COFUND postdoctoral fellow at the Centre for Biodiversity and Conservation, Montpellier (ISEM, France) and at the Kasetsart University in Thailand.

**C. Contributions to Science**

1. **Understanding the origin and cross-species transmission of bat coronavirus beta-barnboranage diversity of coronaviruses (CoVs) and have been identified as the natural reservoirs and evolutionary sources of several emerging human coronaviruses, including Severe Acute Respiratory Syndrome (SARS-CoV) that emerged in China in 2002. However, CoV evolution and host switching are poorly understood. In this study, we use a Bayesian statistical framework to study the evolution of bat CoVs and their cross-species transmission dynamics and dispersal in China. Alpha-CoVs were able to switch hosts more frequently and between more distantly related taxa than beta-CoVs during their evolution. We identify the most likely host switches and geographical locations to define hotspots of CoV phylo-diversity in China, allowing for more targeted surveillance of bat-borne CoVs and early detection to mitigate disease emergence and outbreaks in the future.**

**A. Personal Statement**

Human-environment-wildlife interactions are the driving interest behind my research portfolio. Specifically, my research aims to identify the consequences of land-use change and human-environment interactions on the persistence of wildlife populations, as well as the implications for zoonotic disease spillover to exposed human populations. My research takes a multidisciplinary approach, integrating ecology, epidemiology, and community science to understand the complex interactions between wildlife, their environments, and human communities, ranging from population dynamics and infection dynamics. I have 17 years of experience in wildlife management, with a focus on bats and rodents, and 3 years of international experience in bat disease surveillance in often resource-limited and remote sites. Moreover, I have applied my knowledge in wildlife ecology to identify specific environmental and ecological drivers that enhance pathogen persistence and transmission between wildlife and to proactively prevent spillover events and safeguard human and animal health. My research focuses on understanding the drivers of bat health and disease dynamics at the human-wildlife interface, and development of a cave-based bat conservation.

mammalian orders, yet many populations are declining globally. Working with collaborators in the Philippines, I identified anthropogenic and environmental drivers of bat abundance, and individual health in cave-roosting bats of the Philippines. This research led to the identification of environmental and human disturbance factors that are most influential to bat assemblages, thus allowing for prioritization of caves to conserve cave bats. My findings highlight that human disturbance of roosting and foraging sites contributes to reduced diversity and simplified composition in cave bat assemblages. Minimizing disease risks to public health requires integrating tools from applied ecology and analytical modelling to identify ecological drivers that promote virus persistence and spread in bat assemblages. We found that transmission rates of viruses between bat species (including those with differing ecology), and species that roost in caves having the highest rate of viral sharing with co-roosting species. My research also shows that bats form large aggregations, so assemblage composition and population structure likely influence viral dynamics in cave-roosting bats.

2. **Bat health & disease surveillance.** Zoonotic disease spillover on public health, few studies have examined the ecological mechanisms that promote zoonotic disease persistence in diverse bat assemblages. To understand the underlying individual-level mechanisms that drive compositional turnover and species loss in bat communities, I assessed the impact of environmental factors (e.g., body condition) and ectoparasitism on bat health when exposed to gradients of cave disturbance. I also included measures of cave quality (i.e., size and complexity), social contact (e.g., group size and social network heterospecific abundance), and intrinsic factors (e.g., reproductive state) to understand how context-specific factors may modulate individual health when exposed to disturbance. My findings reveal the importance of cave quality and social contact on the health of cave-roosting bats, which may influence an individual's susceptibility to infection. Working with regional collaborators from Turkey, Armenia, Georgia, Pakistan, and Jordan, I am characterizing the diversity and composition of bat assemblages in the region. I am also conducting a detailed profiling of bat-human interfaces at sampled sites to assess the risk of zoonotic disease emergence in the region.

#### A. Personal Statement

I am an environmental researcher and data scientist specializing in dynamic systems modeling, machine learning and biostatistics, web application development, and data engineering. With a background in environmental health and risk assessment, I provide data science and subject matter expertise to projects related to global emerging infectious diseases, non-communicable diseases, environmental exposures, antimicrobial resistance, and behavioral health. My leadership experience includes serving as a longitudinal study to characterize human exposure to potential toxicants in consumer products. I have been project lead for a large scale human and ecological risk assessment. Currently, I co-lead data management, analysis, and workflow design and automation for the USAID-funded PREDICT project. I have worked with the public community and private sectors, using data to understand risk, support decision making, and inform actionable policy and practice.

#### A. Personal Statement

I am well prepared to use my research, leadership, project management, and communication skills to assist the PIs as a co-investigator in successfully carrying out the proposed research project. My academic and practical training in epidemiology have equipped me with advanced skills in epidemiologic analysis, causal modeling, public health surveillance, and causal inference. My research on Middle East Respiratory Syndrome Coronavirus (MERS-CoV) in Egypt and Jordan for the USAID PREDICT-2 project and for the CDC Global Disease Detection Program have provided me with more than six years of experience in Egypt and Jordan working with communities along the camel value chain to identify MERS-CoV seroprevalence. Additionally, I have worked with the Egyptian and Jordanian governments to identify and monitor MERS-CoV transmission patterns and to monitor activity against alert thresholds in real time. I have also investigated tuberculosis transmission in high-risk populations in Egypt and Jordan. My research in Egypt and Jordan has provided me with a unique perspective on the sociodemographic and cultural context of the region. As the PI for Egypt and Jordan, I have cultivated critical management abilities that will prove beneficial in the proposed research project including time management, budgeting, resource allocation, liaising with community leaders, and stakeholder engagement, and results communication.

**C. Contributions to Science**

**1. Using molecular and geospatial data to conduct epidemiological investigations.** My early research as

an epidemiologist focused on tuberculosis (TB) among public housing residents in New York City (NYC). Advances in case detection in NYC were among foreign-born individuals who became U.S. residents. However, in early 2011, a number of TB cases among NYC public housing residents raised concern that TB may be spreading within public housing residents. If true, this TB transmission occurring within NYC posed an opportunity for public health intervention aimed at interrupting TB transmission. Working with the NYC Department of Health and Mental Hygiene, I identified all TB cases in NYC and ran them against the New York City Housing Authority (NYCHA) registered BINS to classify cases as NYCHA residents. Overall, I found U.S.-born NYCHA residents had twice the TB incidence of all other U.S.-born NYC residents. However, comparing the molecular TB strain data among NYCHA residents, I found that they had high strain diversity. Further, there was no molecular evidence of TB strain clustering within NYCHA buildings, NYC CTR complexes, or between NYCHA residents. Therefore, I concluded the increased burden of TB among NYCHA residents is due to public housing's role as a social safety net, which concentrates a population having many independent TB risk factors: history of HIV, poverty, overcrowding, and due to poor diet, lack of exercise, and other factors. I worked with NYCHA to raise awareness of TB and encourage treatment.

- a. Dawson P, Fung T, Anuja S, et al (2016). High Tuberculosis Incidence in New York City Public Housing Residents. *PLoS ONE* 11(12): e0166111. doi:10.1371/journal.pone.0166111

## 2. Turning epidemiology

the CDC Global Division Region Regional Centers, Egypt, Israel, and the Mediterranean Acute Respiratory Infection Surveillance (EMARIS) network which operates in Iraq-Kurdistan, Jordan, Oman, Pakistan, Qatar, and Yemen. The prevailing thought on influenza seasonality was that many countries or regions with arid/desert-like or tropical climates do not experience pronounced seasonal activity as do other countries with temperate climates (which experience Northern Hemisphere or Southern Hemisphere seasonal patterns). Understanding seasonal influenza is an important public health priority because it may impact seasonal influenza vaccination and the allocation of hospital and clinic resources. I analyzed influenza patterns across seven years of patient data from the EMARIS Network in Egypt and Jordan, and found that both countries exhibit Northern Hemisphere influenza seasonality, reaching peak activity between January and March. We collaborated with our partners in the EMARIS Network and with the Ministries of Health to support redistribution of resources to hospitals and clinics during the winter months. This work is supported by the evidence base supporting the adoption of influenza vaccination in both countries.

- b. Kandeel A, Dawson P, Labib M, Said M, Refaey S, Nasir A (2016). Prevalence and Seasonality of Influenza Hospitalizations in Egypt, January 2007–November 2014. *PLOS ONE* 11(9): e0161301.

## 3. Examining the role of camels in disease development. In

addition to the contributions described above, I have been working with the PRRI on viral spillover, including MERS, in Egypt and Jordan and to characterize the role of camels in conducting triangulated viral surveillance among people, wildlife, and livestock. In both countries, we detect known and novel viruses through the viromics of coronavirus, influenza viruses, Filoviruses, and Paramyxoviruses as well as to detect antibodies to MERS-CoV. All enrolled participants are asked to have nasopharyngeal and oropharyngeal swabs and sera collected and to complete a standardized questionnaire assessing their knowledge of camel husbandry practices. In Jordan, I developed additional questionnaires to assess camel husbandry and behavioral practices pertaining to dromedary camels which are being used to characterize camel behaviors for MERS spillover from camels. This work is supported by the PRRI and was completed in the first half of 2019.

#### A. Personal Statement

I have five years of research training and experience in transforming extensive sets of in-depth interviews and focus group discussions into insightful analyses for critical global health issues. My research and ethnographic datasets has included working with transcripts from Indonesia, Bangladesh, Republic of the Congo, Côte d'Ivoire, and Zambia in investigating seeking and risky behaviors that are often at odds with local norms and regulations. I am currently Coordinator for Behavioral Risk Surveillance at EcoHealth Alliance, a US-based organization that conducts research on emerging zoonoses. Under USAID's PREDICT-2, I am leading several quantitative analyses of behaviors at critical environmental and occupational interfaces known to put vulnerable human populations in close contact with taxa that are often linked to significant emerging infectious diseases risk. Under a framework of analyzing knowledge, attitudes, beliefs, and practices, I am leading research generating country-specific insights that will play a critical role in creating evidence-based intervention recommendations needed to protect vulnerable populations. I have completed research training in [redacted] norms. I have published research in [redacted] datasets.

**C. Contributions to Science**

**1. Understanding the risk factors of zoonotic disease emergence among the high-risk communities.** With its rapid urbanization and development as well as the high diversity of animal species, southern China is facing many social and ecological changes that result in human and animal interactions, leading to the emergence of zoonotic diseases. In order to identify the zoonotic risks and develop a risk-mitigation strategy, we implemented a biological-behavioral surveillance method to demonstrate the serological evidence of viral spill-over into human population, and identify demographic and behavioral risk factors associated with viral exposure and self-reported severe acute respiratory and influenza-like illness symptoms. Combining existing protective factors and intervention opportunities, individual, social, community, and policy level mitigation strategies are recommended to prevent zoonotic risk in southern China.

Wu, M., Wu, Y., Wang, L., et al. (2018) Mammal viromes to better understand the wildlife origin of emerging infectious diseases. *PLoS ONE* 13(1), 178.

**D. Additional Information: Research Support and/or Scholarly Performance**

**Ongoing Research Support**

USAID Emerging Pandemic Threats PREDICT 2 Mazet (PI) 10/01/14 - 09/30/19  
The goal of this project is to create and implement surveillance systems for early detection and analysis of emerging zoonotic pathogens.  
Role: Country Coordinator for China

**Completed Research Support**

R01 AI110334 Daszak (PI) 06/01/14 - 05/31/16  
**Understanding Risk of Bat Coronavirus Infections**  
The goal of this study is to analyze the risk of bat coronavirus infections in southern China.  
Role: Project Coordinator & Human Research Lead

China Environmental Protection Foundation Conservation of Chinese pangolin in National Nature Reserve Zhong (PI) 01/01/16 - 12/31/17  
The goal of this study is to understand the conservation status of Chinese pangolin in mainland China.  
*Chinese pangolin (Manis pentadactyle)* in mainland China  
Role: Community Research Lead

- 1990 -93 Director, Mahidol University Centre for Research on Rabies Pathogenesis and Prevention  
 1997 -98 President, Thai Neurological Association  
 2000 - Director of Neuroscience Centre for Research and Development, Chulalongkorn University Hospital, Thailand  
 2008 - Director, WHO Collaborating Centre of Research and Training on zoonoses  
 2017 - Director, Thai Red Cross Emerging Infectious Diseases Centre

### Other Experience and Professional Memberships

- 1989 -1990 Member of the Board Committee of the Thai Neurological Association  
 1990 -1991 Member of the WHO Expert Advisory Panel on Rabies  
 1998 -01 Member of the WHO Collaborating Centre of Research and Training on zoonoses  
 1999 -03 Member of the WHO Collaborating Centre of Research and Training on zoonoses  
 1999 - Member of the New York Academy of Sciences  
 2006 - Member of the Scientific Committee for the International Conference: Towards the Elimination of Rabies in Eurasia (2007)  
 2006 - Member of the Technical Advisory Group of Alliance for Rabies Control (UK)  
 2006 - Member of Rabies Control in Asia  
 2007 -03 Board member of Office of Knowledge Management and Development  
 2007 -08 Board member of Thai Government Pharmaceutical Organization  
 2013 - WHO member of the International Health Regulations Roster of Experts as an expert in Human-animal interface (Zoonoses)  
 2017 - Member of National Health Reform committee

### Honors

- 1992 National Research Council award for distinguished research projects  
 1993 Mahidol University – B. Brown Prize for distinguished researcher  
 1994 National Research Council award for distinguished researcher  
 2000 (Elected) Corporate Member of American Neurological Association  
 2001 Invited expert in Rabies, 1<sup>st</sup> International symposium on human rabies organized by WHO, Geneva  
 2001 Invited expert in Rabies, 1<sup>st</sup> International meeting in the Americas organized by WHO, Ottawa  
 2004 Outstanding Scientist Award from Foundation for the Promotion of Science and Technology under the Patronage of His Majesty the King  
 2009 Rabies Oration lecture in honor of Eddie and Pilo Bnarucha and received honorary plaque at the World Congress of Neurology, Bangkok  
 2010 (Elected) Fellow of American College of Physicians  
 2014 Member of the National Board on Emerging Infectious Diseases, Thailand  
 2014 Member of Sub-committee on the planning of Emerging Infectious Diseases, Thailand  
 2015 Co-chair Scientific Committee, 1<sup>st</sup> International Congress on Pathogens at Humana and Animal Interface (ICOPAHAI)  
 2017 Honorary lecturer: NTD (Neglected Tropical Diseases)

### C. Contributions to Science

- Research on the neuroimmunology of neurological diseases.** I have spent years researching neuroimmunology in neurological diseases such as autoimmune encephalitis, myasthenia gravis, Guillain-Barré syndrome, and stroke. I have developed clinical and lab-based diagnostics, and have conducted research to differentiate between immune- and infectious encephalitis, in order to facilitate treatments.

**BIOGRAPHICAL SKETCH**

Provide the following information for the Senior/key personnel and other significant contributors.  
Follow this format for each person. **DO NOT EXCEED FIVE PAGES.**

NAME: **William T. Barber**

COMMONS USER NAME (credential, e.g., agency login):

POSITION TITLE:

EDUCATION/TRAINING (Begin with baccalaureate or other initial professional education, such as nursing)

INSTITUTION AND LOCATION	DEGREE (or applicable)	Completion Date (MM/YYYY)	FIELD OF STUDY
University of Malaysia			
The Royal College of Physicians, UK	MRCP	2002	Medicine
The Royal College of Physicians, UK	FRCP	2013	Infectious Diseases

**A. Personal Statement**

I am a Senior Clinical Researcher at the Ministry of Health Clinical Research Centre, Kota Kinabalu Sabah (2008 – present) and also Head of Infectious Diseases at Gleneagle Hospital, Kota Kinabalu (2017 – present). In 2015 I was the State Infectious Diseases Physician for Sabah. I am President of the Infectious Diseases Society, Kota Kinabalu track Physician Training at the Queen Elizabeth Hospital, Kota Kinabalu. Training from 2004 to 2008, including at the Kuala Lumpur General Hospital, Royal Darwin Hospital, Australia. I am a Fellow of the Royal College of Physicians of Edinburgh and an Honorary Research Consultant with the Menzies School of Health Research, Malaysia National Clinical Practice Guideline Committee for Malaria, Infection Control, HIV/AIDS and Adult Vaccinations. My research on *Plasmodium knowlesi* in the Menzies CRC collaboration has been incorporated into not only National but also WHO Guidelines for the Treatment for Severe Malaria (2014, 2016 and now 2017).

## B. Positions and Honors

### Positions and Employment

- 1996-96 Medical Officer, Tambunan Hospital, Sabah, Malaysia
- 1999-02 Medical Officer, Dept. of Medicine, Queen Elizabeth Hospital, Kota Kinabalu, Sabah, Malaysia
- 2003-05 Consultant Clinician for Infectious Disease and Clinical Specialist of Infectious Diseases, Kuala Lumpur Hospital, Malaysia
- 2006 General Physician for Internal Medicine and Infectious Diseases, Specialist Infectious Diseases, Elizabeth Hospital, Kota Kinabalu, Sabah, Malaysia
- 2007 Registrar, General Practice, Queensland Health, Australia
- 2008-15 Consultant, Infectious Disease Unit, Queen Elizabeth Hospital, Kota Kinabalu, Sabah, Malaysia
- 2008 - Clinical Researcher, Queen Elizabeth Hospital Clinical Research Centre, Kota Kinabalu, Sabah, Malaysia
- 2012 - Honorary Associate Professor, Universiti Malaysia Sabah, Malaysia
- 2012 - President, Infectious Disease Society, Kota Kinabalu, Sabah, Malaysia
- 2017 - Infectious Disease Consultant and Head of Infectious Diseases Unit, GLENELG HOSPITAL, Kinabalu, Sabah, Malaysia

### Other Experience and Professional membership

- Member, Malaysian Medical Association
- Member, Malaysian Medical Council
- Executive Committee, Sabah Medical Association
- President, Infectious Disease Society, Sabah, Malaysia

### Honors

- 2003 Professional Excellence Award, Ministry of Health, Sabah, Malaysia
- 2003 Royal Patron, Glenda Award (Kudat Award), Sabah, Malaysia
- 2009 Professional Excellence Award, Ministry of Health, Sabah, Malaysia
- 2010 Professional Excellence Award, Ministry of Health, Sabah, Malaysia
- 2013 American Society of Tropical Medicine and Hygiene, Malaysia
- 2017 Merdeka Award for Health, Science and Technology

## C. Contributions

**1. Publications** I have authored 60 publications with 2000 citations. These publications have made a significant contribution to the knowledge of the epidemiology, clinical features and treatment of *P. knowlesi* malaria. My studies on an endemic severe malaria in Sabah (William et al. *Emerg Infect Dis* 2011, Barber et al. *Infect Dis* 2013) have changed global (WHO) and SEA Asian policy and practice. With collaborators Anstey, Barber and Grigg, my RCTs of artemisinin combination therapy for non-falciparum species have led to national policy change to universal ACT for uncomplicated vivax and knowlesi malaria. In Sabah, I lead a large ongoing program of research into the prevention, surveillance and management of malaria and other tropical infections with national and international collaborators. In 2017 I was a joint recipient of Malaysia's prestigious **Merdeka Award in Health, Science and Technology** for outstanding contribution to the treatment of knowlesi malaria.

- a. Grigg MJ, **William T**, Menon J, Dhanaraj P, Barber BE, Wilkes CS, von Sechen A, Pasay C, M. Cártny O, P. N. Anstey NMT, Yeo TW (T. equal contribution). (2016). A randomized open-label clinical trial of artesunate-fluoroquinolone combination for the treatment of uncomplicated *Plasmodium knowlesi* malaria in Sabah, Malaysia (ACT KNOW trial). *Lancet Infect Dis* 16(2):180-8.
- b. Rajahram GS, Barber BE, **William T**, Grigg MJ, Menon J, Yeo TW, Anstey NM (2016). Falling *Plasmodium knowlesi* malaria death rate among adults despite rising incidence, Sabah, Malaysia, 2010-2014. *Emerg Infect Dis* 22(1).
- c. Grigg MJ, Cox J, **William T**, Jelip J, Fornace KE, S. S. Subramanian, S. S. Subramanian, Yeo TW, Prakelev CJ (2017). Individual factors associated with the risk of acquiring human *Plasmodium knowlesi* malaria in Malaysia: a case-control study. *Lancet Infect Dis* 17(10):1077-1084.
- d. Grigg MJ, **William T**, Barber BE, Rajahram GS, Menon J, Subramanian S, Patek K, Chanana A, Prince PN, Yeo TW, Anstey NM (2016). Efficacy of primaquine in the treatment of uncomplicated *Plasmodium knowlesi* malaria: an open-label, randomised controlled trial (CAN KNOW). *Clin Infect Dis* 66(2):220-226.

**D. Additional Information: Research Support and/or Scholastic Performance**

**Ongoing Research Support**

NIH 1R01 AI116472-01	William (PI)	2015-2021
Comparative incidence and clinical spectrum of <i>Plasmodium knowlesi</i> malaria, a longitudinal study in Malaysia
